

Binding users to TRUECHART in Power BI

Since TRUECHART is a multi-user environment, it is necessary to supply a user identification. There are two possible ways described in the following sections: Entering the user name directly, or using a User name measure.

Entering the user name directly

The user name can be applied directly through initial screen and click on *OK*-button.

Enter a fixed user name here:

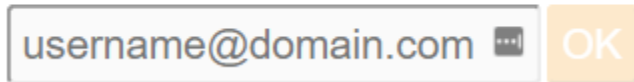

Figure 1. Add username through initial screen

warning

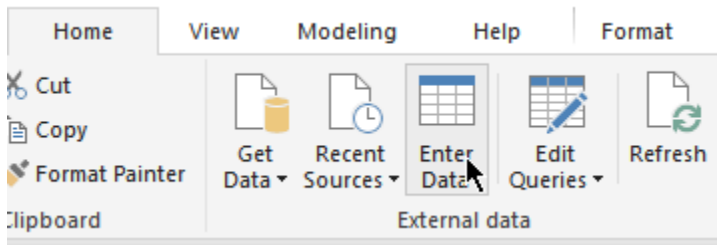

By entering a user name directly in the TRUECHART visual, you will share **your** user identification when publishing the report. To avert this, use a user name measure instead as described in the next section.

info

When changing the user name, it is necessary to reload the report for the changes to take effect.

User name measure

In the **Home** tab, section **External data**, click on **Enter Data**.

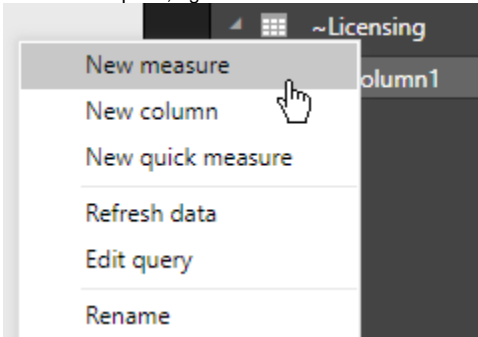

In the **Create Table** dialog, enter a name for the new table. You may want to use a prefix (e.g. _ or ~) to make the table appear at the beginning/end in the table list of the **Fields** pane.

Click on **Load** to create the new table.

Name:

Load Edit Cancel

In the **Fields** pane, right-click on the new table and choose **New measure**.

Enter the DAX formula to create a column *Username* with the current user's name as its value.

You may now delete the redundant *Column1* column by right-clicking on it and choosing **Delete**.

info

If you happen to supply both a static user name and a user name measure, the latter will apply.
